PRODUCT LEADERSHIP

Skip agile. You just need these five skills.

This is big news. Have all five, and you can skip discovery, small batches and retros. Go straight to the plan. And stick to it.

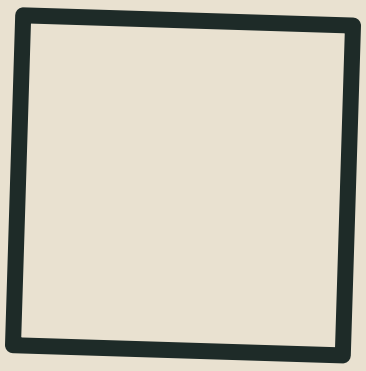

swipe →

7

Know the future.

Know exactly what your users will want, and what the market will look like, on the day you finally ship.

> WITHOUT IT
>
> Test your ideas with real users before you build them. That's discovery.

2

Don't make any mistakes.

Get every requirement, every design and every estimate right the first time. Every time.

WITHOUT IT

Ship in small batches, so each mistake is small, cheap and quick to fix.

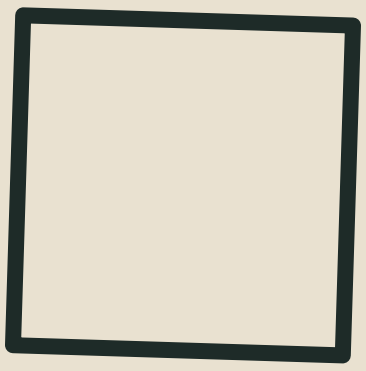

3

Learn nothing.

Nothing you find out along the way should change the plan. Not users, not data, not the market.

WITHOUT IT

Inspect and adapt. Let what you learn steer the next step.

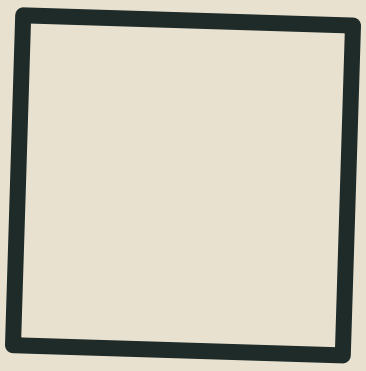

4

Invent nothing.

The solution already exists and is fully known. All you need to do is put it in place.

> WITHOUT IT
>
> If nobody has built it before, you find out how by building it, one step at a time.

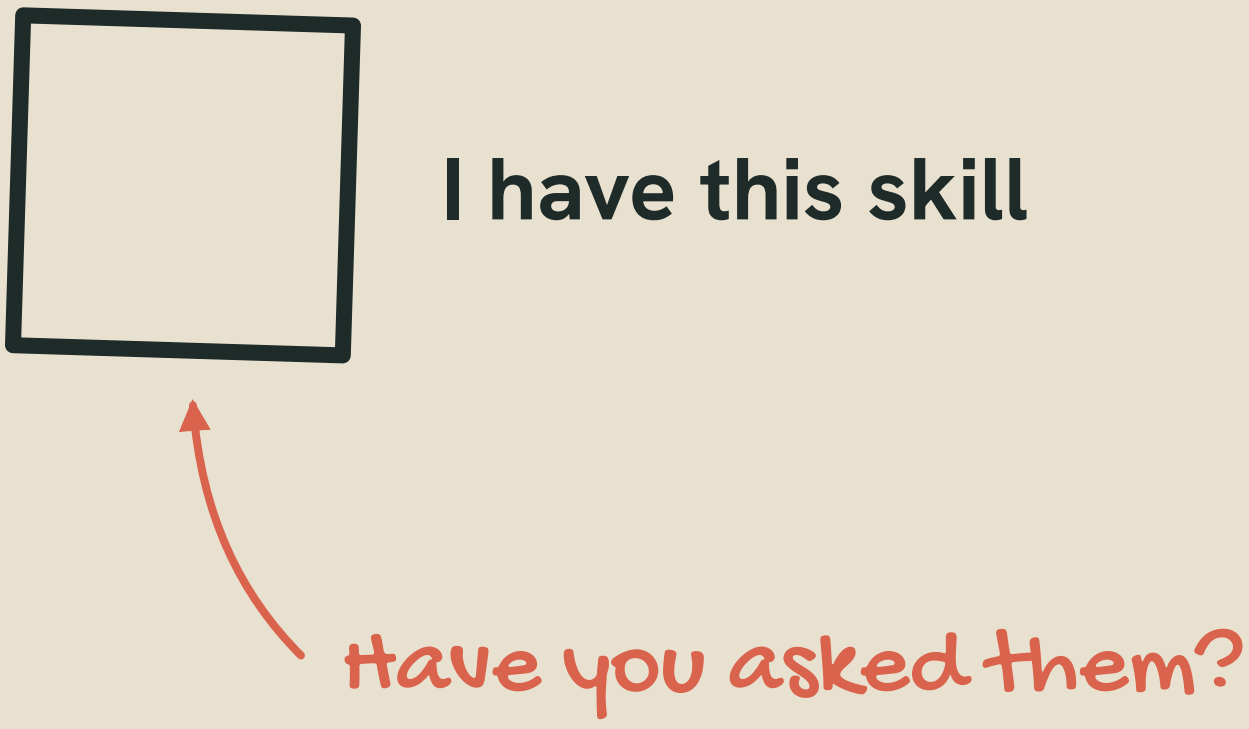

S

Don't try anything new.

No new technology, no new customers, no new markets. And your competitors promise to do the same.

> WITHOUT IT
>
> Run small experiments. Keep what works, drop what doesn't.

THE SCORE

Nobody ticks all five. That is the case for agility.

Every empty box is a reason to work in small steps, learn fast and adjust your course.
